ABSTRACT OF THE DISCLOSURE

10 A collaboration archive recorder accepts information from plural media
through a network and archives the information as a collaboration session having a
temporal relationship between the stored media information for subsequent re-
creation of the collaboration. A media input interface accepts plural media types,
such as audio, video, Web conferencing and application specific information, and
provides the information to an archive engine for conversion to an archive format in
15 which the information is related to each other by its presentation time during the
collaboration. An archive output adapter presents all or selected portions of the
collaboration session through a user interface that allows selection of archived
information by content and the temporal relationship.
